

# N32WB03x Series Bluetooth® Low Energy SoC

## Datasheet

---

N32WB03x series adopts a 32-bit ARM Cortex-M0 core with a maximum operating frequency of 64MHz. It supports BLE 5.1 and SIG Mesh, has a transmit current of 4.2A, a receive current of 3.8Ma, a maximum transmit power of +6 dBm, and a receive sensitivity of -96 dBm @BLE 1 Mbps.

---

## Key Features

- CPU core
  - 32-bit ARM Cortex-M0 core
  - Maximum frequency of 64 MHz
- Memories
  - 256K/512K bytes Flash
  - 48K bytes SRAM
- Power consumption
  - Receive current: 3.8 mA@3.3V
  - Transmit current: 4.2 mA @0dBm/3.3V
  - Sleep mode (48 KB RAM retained): 1.4 µA@3V
  - PD mode: 130nA
- RF specification
  - RX sensitivity: -96 dBm @BLE 1Mbps
  - RX sensitivity: -93 dBm @BLE 2Mbps
  - Programmable transmit power, up to +6dBm
  - Single-ended antenna interface
- Clock
  - HSE: 32 MHz high speed external crystal
  - LSE: 32.768 kHz low speed external crystal
  - HSI: high speed internal RC 64 MHz
  - LSI: low speed internal RC 32 kHz
  - Support one clock output; different clock output can be configured; clock can be output after divided by four.
- Reset
  - Power-on/off/external pin reset
  - Watchdog reset.
- Communications interfaces
  - 2× USART interfaces, with rate up to 4 Mbps (configurable as ISO7816, IrDA, LIN)
  - 1× LPUART interface, featuring low-power dissipation, supporting communication rate up to 9,600 bps and low-power wakeup in Sleep mode.
  - 2× SPI interfaces, with rates up to 16 MHz, master/slave configurable, supporting I2S.
  - 1× I2C interface, with rate up to 1 MHz, master/slave configurable
- Timers
  - 1× 16-bit advanced counter, supporting functions like input capture, output compare, PWM output, and quadrature encoder input; 4 independent channels, 3 of which support 6 complementary PWM outputs.
  - 1× 16-bit general-purpose counter, supporting functions like input capture, output compare, PWM output, and mono-pulse output, with 4 independent channels.

- 1× 16-bit basic counter
- 1× 24-bit system timer
- 1× 7-bit window watchdog (WWDG)
- 1× 12-bit independent watchdog (IWDG)
- Analog interface
  - 1× 10-bit 1.33 Msps ADC (configurable as 16-bit 16 Ksps), supporting 5 external single-ended channels, 1 differential MIC channel, 2 internal channels.
  - Built-in PGA up to 128x
  - MIC BIAS voltage, adjustable between 1.6 V and 2.3 V
- 21× GPIO, supporting multiplexing.
- 1× high speed 5-channel DMA controller
- 1× IR transmission controller, supporting all infrared remote-control protocols.
- 1× KEYSKAN module, where 8/10/13 GPIOs support 44/65/104 key functions respectively
- RTC real-time clock, supporting perpetual calendar (that can identify leap years), alarm events, and periodic wakeup.
- Support hardware CRC16 and CRC32 operations.
- Operating conditions
  - Operating voltage: 1.8V/2.32 V~3.6 V
  - Operating temperature: -40°C~85°C
  - ESD: ±2 KV (HBM)
- Package
  - QFN32 (4 mm × 4 mm)
- Ordering Information

# 1 Overview

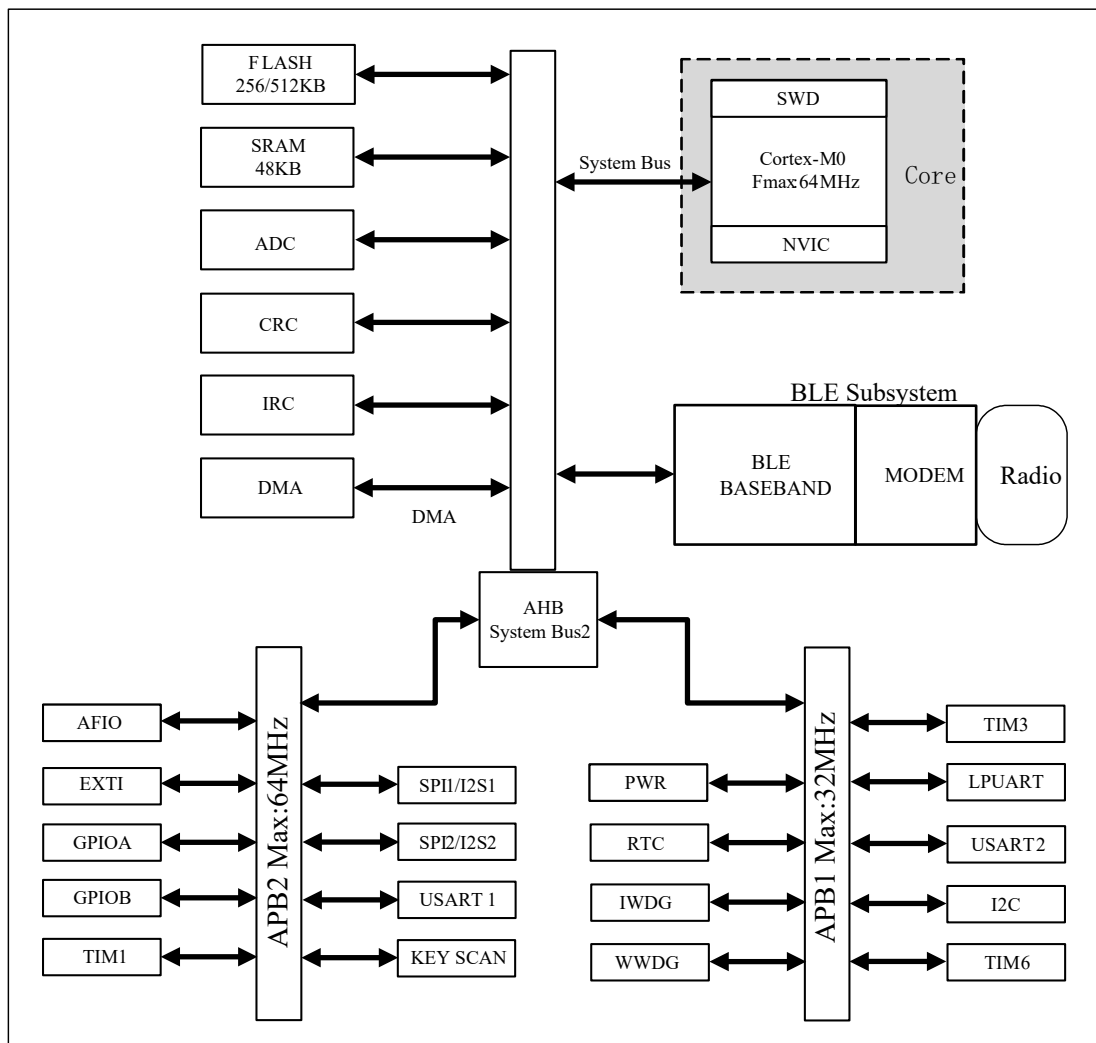

N32WB03x series Bluetooth® Low Energy SoC is Nsing high performance, ultra-low-power consumption Bluetooth 5.1 chips, featuring a 32-bit ARM Cortex®-M0 core with a maximum operating frequency of 64 MHz, it integrates 48 KB of SRAM and 256/512 KB of Flash memory on-chip.

Integrated with an advanced BLE 5.1 RF transceiver, it is compliant with the BLE 5.1 standard and provided with multiple modes including standard 1Mbps BLE mode, enhanced 2Mbps BLE mode, 125 kbps BLE remote mode (S8), and 500 kbps BLE remote mode (S2). In the 1Mbps or 2Mbps BLE mode, it supports AoA (Angle of Arrival) and AoD (Angle of Departure), RSSI (Received Signal Strength Indication), master/slave role, multi-connection, data packet length extension, KEYSKAN, IRC, 10-bit 1.33 Msps ADC (configurable as 16-bit 16 Ksps), analog MIC input, PGA, basic, general, and advanced timers, RTC, WWDG, IWDG, LPUART, USART, SPI, I2C, and other peripherals.

It is suitable for various application scenarios such as Bluetooth KEY, OBU, data transmission module, Bluetooth voice remote controller, and smart home devices, and more.

Figure 1-1 shows the block diagram of N32WB03x series.

10-bit ADC (channels)		1(8)	
KEYSCAN		Supports 8/10/13 GPIOs for 44/65/104 keys	
IRC		1	
CRC		CRC16/CRC32	
Package		QFN32 (4 mm × 4 mm)	

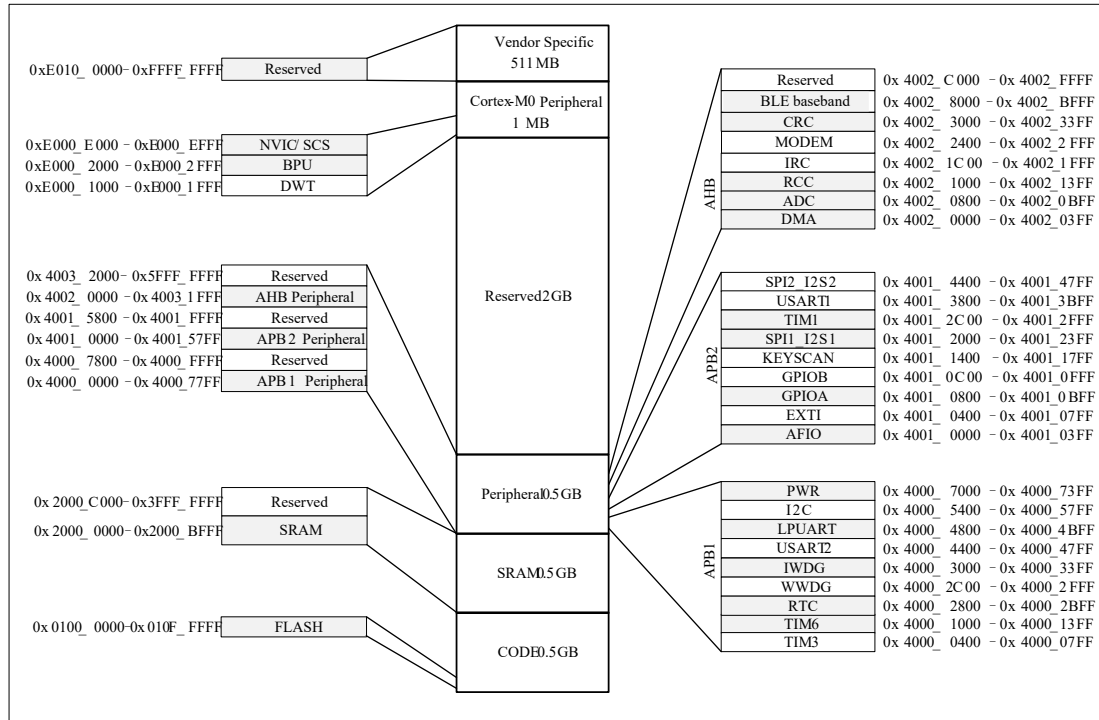

## 2 Features Overview

### 2.1 Processor Core

The N32WB03x series integrates an ARM Cortex®-M0 processor.

### 2.2 Memory

Figure 2-1 Memory Mapping

#### 2.2.1 Flash

256k or 512K bytes of Flash, with a maximum program memory of 256k bytes, and the remaining space for data storage.

#### 2.2.2 SRAM

48K bytes of SRAM, which can be fully retained in Sleep mode.

### 2.3 Low Power Modes

N32WB03x series supports four low power modes.

- Idle Mode

Only the CPU stops running. All peripherals are working and can wake up the CPU in the event of any interruption or event.

- Standby Mode

The power supply works as usual. The CORE power domain is turned off. The BLE is available.

- Sleep Mode

The high-speed clock is switched off. The power supply runs in the low power mode. The CORE power domain and BLE are turned off.

- PD Mode

All systems are shut down. Only WAKEUP IO and NRST can be woken up.

## 2.4 Clock System

Two high speed clocks:

- HSI oscillator clock (64 MHz)
- HSE crystal or ceramic resonator clock (32 MHz)

Two secondary clock sources:

- LSI oscillator clock (32 KHz)
- LSE crystal or ceramic resonator clock (32.768 KHz)

After the system is powered on and reset, HSI and HSE are enabled, and the system clock is set to HSI by default. LSI can be used to drive the IWDG. Both LSI and LSE can selectively drive RTC, KEYSKAN and LPUART through a program. Moreover, LSI/LSE can automatically wake up the system in the Idle/Standby/Sleep/PD mode. If not in use, either clock source can be turned on or off independently to optimize system power dissipation.

Figure 2-2 Clock Tree

## 2.5 General Purpose Input/Output (GPIO)

GPIO stands for general purpose input/output. AFIO stands for alternate-function input/output. A chip supports up to 21 GPIOs, which are divided into 2 groups (GPIOA/GPIOB). GPIOA has 7 ports and GPIOB has 14 ports. GPIO ports share pins with other multiplexed peripheral functions and can be flexibly configured as required. Each GPIO pin can be independently configured as an output, input, or multiplexed peripheral functional port, as well as its high current drive capability.

Main features:

- GPIO ports can be configured through software to the following modes:

- Input floating
- Input pull-up
- Input pull-down
- Analog function
- Output open-drain
- Output push-pull
- Alternate function push-pull
- Alternate function open-drain
- Separate bit setting or bit clearing function
- All I/O supports external interrupt
- All I/Os can be woken up from low power modes, with configurable rising or falling edge
- Eight EXTIs can wake up the Sleep mode and all I/O can be multiplexed as EXTI
- PB3 can wake up I/O from the PD mode
- Support remapping of AFIO through software
- Support GPIO locking mechanism and removal of locking status through resetting
- Each I/O port register bit is freely programmable, but it must be accessed as 32-bit words (16-bit half-word or 8-bit byte access is not allowed).

## 2.6 External Interrupt/Event Controller (EXTI)

The EXTI consists of 14 edge detectors for generating interrupt/event requests. Each interrupt line can be independently configured as an event or interrupt and the corresponding trigger event (rising edge or falling edge or both). Each line can also be masked independently. A pending register maintains the status line of the interrupt request. This request can be cleared by writing a '1' in the corresponding bit of the pending register.

## 2.7 Direct Memory Access (DMA)

DMA is integrated with one 5-channel DMA controller to manage data transfer from memory to memory, from peripheral to memory and from memory to peripheral.

Each channel has a dedicated hardware DMA request logic and can be triggered by software. The transfer length, source address and destination address of each channel can be set separately by software.

DMA is applicable to main peripherals including SPI, I2S, I2C, USART, ADC, and basic, general, and advanced control TIMx.

## 2.6 Cyclic Redundancy Check Calculation Unit (CRC)

It integrates CRC32 and CRC16 functions. The Cycle Redundancy Check (CRC) calculation unit generates any CRC calculation result based on a fixed generator polynomial. In many applications, CRC-based techniques are used to verify the consistency of data transmission or storage. Within the scope specified in EN/IEC 60335-1 standard, it provides a means to detect flash memory errors. The CRC calculation unit can be used to calculate the signature of software in real-time and compare it with the signature generated during the linking and generation of the software.

Main features:

- CRC16: supports the polynomial  $X_{16}+X_{15}+X_2+X_0$
- CRC16 computing time: one AHB clock period (HCLK)
- CRC32: supports the polynomial  $X_{32} + X_{26} + X_{23} + X_{22} + X_{16} + X_{12} + X_{11} + X_{10} + X_8 + X_7 + X_5 + X_4 + X_2 + X + 1$
- CRC32 computing time: four AHB clock periods (HCLK)
- Configurable CRC initial value

- Support DMA mode

## 2.9 Timer and Watchdog

It includes 1× advanced timer, 1× general-purpose timer, 1× basic timer, 2× watchdog timer, and 1× system tick timer.

### 2.9.1 Basic Timer (TIM6)

The basic timer (TIM6) contains a 16-bit auto-loading counter driven by a programmable prescaler. It can provide a time baseline for general-purpose timers.

Main features:

- 16-bit automatic reloading accumulating counter
- 16-bit programmable (can be modified in real-time) prescaler, used to divide the input clock by any value between 1 and 65536
- Generate an interrupt/DMA request when an event is updated (counter overflow)

### 2.9.2 General-purpose Timer (TIM3)

The General Purpose Timer (TIM3) contains a 16-bit auto-load up/downcounter, a 16-bit prescaler, and 4 independent channels. Each channel can be used for input capture (to measure pulse width), output compare, PWM, and single-pulse output.

Main features:

- 16-bit up, down, or up/down auto-loading counter
- 16-bit programmable (can be modified in real-time) prescaler, with a counter clock frequency divisor between 1 and 65536.
- 4 independent channels:
  - Input capture
  - Output compare
  - PWM generation (edge or middle alignment)
  - Single-pulse mode output
- Use external signal to control the timer and synchronize the interconnected circuits of the timers
- Generate interrupt/DMA in the case of the following events:
  - Update: up/downcounter overflow, counter initialization (software-based trigger or internal trigger)
  - Trigger events (startup, shutdown, and initialization of counter, or internally triggered counting)
  - Input capture
  - Output compare
- Support the incremental (quadrature) encoders for positioning and Hall sensor circuits
- Use trigger input signal as the input of external clock, or perform periodic current management

### 2.9.3 Advanced Timer (TIM1)

TIM1 consists of a 16-bit auto-loading counter driven by a programmable prescaler. It provides multiple functions, including measuring the pulse width of the input signal (input capture) or generating output waveform (such as output compare, PWM, and complementary PWM outputs with dead time in between). Using the timer's prescaler and RCC clock control prescaler can adjust the pulse width and waveform period from several microseconds to several milliseconds.

Main features:

- 16-bit up, down, or up/down auto-load counter
- 16-bit programmable (can be modified in real time) prescaler; with a counter clock frequency division factor

between 1 and 65536

- Supports up to 64 MHz as timer input clock
- Up to four independent channels:
  - Input capture
  - Output compare
  - PWM generation (edge or middle alignment)
  - Single pulse mode output
- Trigger time points can be configured by software in the entire PWM cycle
- Complementary output with programmable dead time
- A synchronous circuit that uses an external signal control timer or allows interconnection of multiple timers
- A repetitive counter to update the timer registers only after a given number of cycles of the counter
- Break input signal can put the timer's output signals in a reset state or in a known state
- Generate interrupt/DMA in the case of the following events:
  - Update: up/downcounter overflow, counter initialization (software-based trigger or internal/external trigger);
  - Trigger events (startup, shutdown, and initialization of counter, or internally/externally triggered counting);
  - Input capture
  - Output compare
  - Break signal input
- Support the incremental (quadrature) encoders for positioning and Hall sensor circuits.
- Use trigger input signal as the input of external clock, or perform periodic current management.

In the debug mode, a counter can be frozen and PWM outputs are disabled, cutting off the switches controlled by those outputs. The advanced timer has many functions similar to and the same internal structure as that of the standard TIM timer. Therefore, it can work with the TIM timer through the timer's link function to provide synchronization or event link function.

#### 2.9.4 System Tick Timer (Systick)

This timer is tailored to a real-time operating system and can also be used as a standard downcounter. It has the following features:

- 24-bit downcounter
- Auto-reload feature
- Generate a maskable system interrupt when the counter reaches zero.
- Programmable clock source

#### 2.9.5 Watchdog Timer (WDG)

It supports both independent watchdog (IWDG) and window watchdog (WWDG). Two watchdogs ensure higher security, time accuracy, and flexibility in use.

##### Independent Watchdog (IWDG)

The IWDG is based on a 12-bit downcounter and an 8-bit prescaler, and is driven by a separate, low speed RC oscillator. It still can work even if the master clock fails. Once activated, the IWDG will generate a reset signal when the counter reaches 0x000 if the watchdog's counter is not cleared within a given period. Moreover, it can also be used to reset the entire system in the event of an application error, or as a free timer to provide timeout management for applications.

##### Window Watchdog (WWDG)

The WWDG is typically used to monitor software failures caused by application deviating from the normal running sequence due to external disturbances or unforeseen logical conditions. Unless the value of a downcounter is refreshed

before the T6 bit reaches zero, the watchdog circuit will generate a chip reset when the preset time cycle is reached. A chip reset is also generated if the value of a 7-bit downcounter (in the control register) is refreshed before the downcounter reaches the value of the window register. This indicates that the downcounter needs to be refreshed with a limited time window.

Main features:

- WWDG is driven by the clock derived from the prescaled APB1 clock.
- Programmable free-running downcounter
- Conditional reset
- A reset occurs when the value of the downcounter is less than 0x40 if the watchdog is enabled
- A reset occurs when the downcounter is reloaded outside the window if the watchdog is enabled
- If the watchdog is enabled and interrupt is allowed, an EWI is generated when the value of the downcounter reaches 0x40, and it can be used to reload the counter to avoid resetting WWDG.

## 2.10 ADC

Support 10-bit 1.33 Msps ADC (configurable as 16-bit 16 Ksps), single-ended or differential AMIC, and built-in PGA with a gain up to 42 dB.

Provide adjustable (1.6–2.3 V) MIC BIAS voltage for MIC.

Up to 8 channels, including 5 external single-ended channels, 1 differential MIC channel, and 2 internal channels. Two internal channels are VCC detection channel and temperature sensor channel. For 5 external channels, the detection range of channels 1 (PB10) and 2 (PB9) is 0V-1V, and that of channels 3 (PB8), 4 (PB7), and 5 (PB6) is 0V-3.6V. the input voltage of channels 3 (PB8), 4 (PB7), and 5 (PB6)  $\leq V_{CC} + 300$  mV.

In the audio mode, using the built-in PGA and microphone bias, MIC signals are amplified by the PGA, and then converted to digital signals by an ADC. After the audio input control (low-pass decimation filter and optional energy and zero-cross detection), the audio data is stored in the system RAM through DMA. Finally, 16-bit 16 kHz audio signal format data is output.

Main features:

- Support analog microphone (AMIC) input, with adjustable microphone bias
- PGA supports single-ended or differential input and adjustable gain
- Support one ADC, which can measure 5 external single-ended channels, 1 differential MIC channel, and 2 internal channels (input channels are optional)
- Support two internal channels, including TempSensor and VCC
- 10-bit 1.33 Msps ADC (configurable as 16-bit 16 Ksps)
- Support digital decimation filter to 16-bit and noise filter
- Support single and continuous conversion modes
- A DMA request can be generated during channel switching
- The analog watchdog feature allows an application to detect whether the input PB10 voltage exceeds a user-defined high/low threshold
- An interrupt occurs at the end of switching or in the case of an analog watchdog event
- In the audio mode, the filter's output data is stored in a 16-bit data register, and in the general mode, the data is right-aligned and stored in a 16-bit data register
- In the audio mode, data is output in 16-bit 16 Ksps signed mono PCM format, and in the general mode, data is output in 10-bit 1.33 Msps unsigned format

## 2.11 I2C Bus Interface (I2C)

The I2C bus interface provides multi-master function that controls all the I2C bus specific sequences, protocol, arbitration and timing. It supports multiple communication rate modes (up to 1 MHz), DMA operations, and SMBus 2.0. The I2C

module suits multiple purposes, including CRC code generation and verification, SMBus (System Management Bus), and PMBus (Power Management Bus).

Main features:

- Multi-master capability: The module can be either a master device or a slave device
- I2C master functionality
  - Clock generation
  - Start and stop signal generation
- I2C slave functionality
  - Programmable address detection
  - Supports 7-bit or 10-bit addressing, dual slave address response in 7-bit slave mode
  - Stop bit detection
- Generates and detects 7-bit/10-bit addresses and broadcast call
- Support different communication speeds
  - Standard rate (up to 100 kHz)
  - Rapid (up to 400 kHz)
  - Rapid+(up to 1 MHz)
- Support various status flags
  - Transmitter/receiver mode flag
  - End of byte transmission flag
  - I2C bus busy flag
- Support various error flags
  - Arbitration is lost in the master mode
  - Acknowledgement (ACK) error after address/data transfer
  - Misplaced start or stop condition detected
  - Overflow or underflow when the clock stretching is disabled
- One interrupt vector:
  - Event interrupt and error interrupt share an interrupt vector
- Optional clock stretching
- Single-byte buffer with DMA capability
- Generation or verification of configurable PEC
  - The PEC value can be transmitted as the last byte in the transmitter mode
  - PEC for the last received byte
- Compatible with SMBus 2.0
  - 25 ms clock low timeout delay
  - 10 ms cumulative time for low clock extension for master device
  - 25 ms cumulative time for low clock extension for slave device
  - Generation or verification of hardware PEC with ACK control
  - Support address resolution protocol (ARP)
- Compatible with SMBus

## 2.12 Universal Synchronous Asynchronous Receiver Transmitter (USART)

The USART is integrated with 3 serial receiver/transmitter interfaces, including USART1, USART2, and LPUART. USART1 and USART2 interfaces support synchronous/asynchronous communication, IrDA SIR ENDEC transmission coding and decoding, multiprocessor communication mode, single-wire half-duplex communication mode, and LIN master/slave function.

USART1 and USART2 interfaces also support the CTS and RTS hardware flow control, and the single-wire mode such as the ISO7816 smart card standard. DMA is available to both interfaces.

Main features:

- Full-duplex asynchronous communication
- Single-wire half-duplex communication
- NRZ standard format
- Fractional baud rate generator system – a common programmable transmitting and receiving baud rate up to 4 Mbits/s
- Programmable data word length (8 or 9 bits)
- Configurable stop bits – support for 1 or 2 stop bits
- LIN master is capable of sending synchronous break and LIN slave is capable of detecting the break: 13-bit break is generated, and 10/11-bit break is detected when USART hardware is configured to LIN
- Transmitter clock output for synchronous transmission
- IRDA SIR encoder-decoder: Support for 3/16-bit duration in normal mode
- Smart card emulation capability
  - The smart card interface supports the asynchronous smart card protocol as defined in the ISO7816-3 standard.
  - 0.5 and 1.5 stop bits for smart card
- Single-wire half-duplex communication
- Configurable multi-buffer communication using DMA – buffering of received/transmitted bytes in SRAM using centralized DMA
- Separate enable bits for transmitter and receiver
- Detection flags
  - Receive buffer full
  - Transmit buffer empty
  - End of transmission flags
- Parity control
  - Transmits check bits
  - Check the received data parity
- Four error detection flags
  - Overflow error
  - Noise error
  - Frame error
  - Parity error
- Ten USART interrupt sources with flags
  - CTS change
  - LIN break detection

- Transmit data register empty
- Transmission completed
- Receive data register full
- Detected idle bus
- Overflow error
- Frame error
- Noise error
- Parity error
- Multiprocessor communication – If addresses do not match, enable the silent mode
- Wake up from silent mode (by detecting idle bus or address flag)
- Two ways to wake up the receiver: address bit (MSB, 9th bit), bus idle
- Mode configuration:

Communication mode	USART1	USART2	LPUART
Asynchronous mode	Supported	Supported	Supported
Hardware flow control	Supported	Supported	Supported
Multi-buffer communication (DMA)	Supported	Supported	Supported
Multiprocessor communication	Supported	Supported	Not supported

## 2.13 Serial Peripheral Interface (SPI)

It supports Two SPI interfaces. SPI allows the chip to communicate with external devices in a half/full-duplex, synchronous, and serial communication between chips and peripherals. SPI can be configured to operate in the master mode and provide a communication clock (SCK) for the external slave device. Moreover, The interface can also work in a multi-master configuration and support reliable communication with CRC verification.

Main features:

- Full-duplex synchronous transmission
- Double-wire simplex synchronous transmission with/without the third two-way data cable
- 8-bit or 16-bit transmission frame format
- Support master or slave mode
- Support multi-master mode
- Rapid communication between master and slave modes

- NSS management can be performed by software or hardware in the master or slave mode: dynamic switching of master/slave mode
- Programmable clock polarity and phase
- Programmable data sequence, with MSB or LSB in the first order
- Dedicated transmit and receive flags to trigger interrupt
- SPI bus busy flag
- Support reliable communication based on hardware CRC
  - The CRC value can be transmitted as the last byte in the transmitter mode
  - Automatic CRC for the last received byte in the full-duplex mode
- Master mode failure, overload, and CRC error flags that trigger interrupt
- Single-byte transmit and receive buffers with DMA support: Generate transmission and receiving requests
- Maximum interface speed: 16 Mbps

## 2.14 Serial Audio Port (I2S)

I2S is a 3-pin synchronous serial interface communication protocol that can work in master or slave mode, it can be configured for 16/24/32-bit transfers, and also can be configured a input or output channel, supporting audio sampling rates from 8 kHz to 96 kHz. It supports four audio standards, including the Philips' I2S standard, the MSB and LSB alignment standards, and the PCM standard.

It works in both master and slave modes in half-duplex communication. When it works as the master device, it provides clock signals to external slave devices through the interface.

Main features:

- Half-duplex communication (either transmitting or receiving only at a time)
- Master or slave operation
- 8-bit linear programmable prescaler to obtain an accurate audio sample frequency (8 kHz~96 kHz)
- 16/24/32-bit data format
- 16-bit (16-bit data frame) or 32-bit (16/24/32-bit data frame) fixed packet frame for audio channel
- Programmable clock polarity (stable state)
- Underflow flag bit in the slave transmitter mode and overflow flag bit in the master/slave receiving mode
- 16-bit data register to transmit and receive, one in each end of the channel
- Supported I2S protocols
  - Philips' I2S standard
  - MSB alignment standard (left-justified)
  - LSB alignment standard (right-justified)
  - PCM standard (a 16-bit channel frame with long or short frame synchronization; or extension from a 16-bit data frame to a 32-bit channel frame)
- Data sequence: MSB is always in the first order
- DMA is available to both transmitter and receiver

## 2.15 Real Time Clock (RTC)

RTC has a set of BCD timers/counters that count independently continuously. In the corresponding software configuration, RTC can provide the calendar function. RTC also has a programmable alarm clock interrupt.

The two 32-bit registers contain the subsecond, second, minute, hour (in 12- or 24-hour format), day of the week, day (day of the month), month, and year data in decimal format (BCD).

The subsecond value is provided by a separate 32-bit register in binary format. The other 32-bit register contains programmable second, minute, hour, day of the week, day, month, and year data.

RTC has the feature of automatic wakeup in low power mode.

## 2.16 Infrared Controller (IRC)

The infrared controller can generate different infrared protocol signals by configuring different types of coding through software and supports the software-based infrared self-learning function.

Main features:

- Carrier frequency range: 30 kHz~60 kHz
- Support pulse width coding and pulse spacing coding
- Support Manchester coding
- Support carrier-free mode
- Support any combination of Mark code and Space code
- Provide 16 (depth) × 21-bit (width) Code FIFO for storing coded commands
- Support repeatedly sending commands
- Generate interrupt upon the end of transmission

## 2.17 Automatic Key Scanning (KEYSCAN)

Support 8/10/13 IO ports, corresponding to 44/65/104 keys respectively.

Support debouncing of keys

Support three modes: automatic scan, software scan, low-power scan

- Automatic mode: Configurable automatic scanning mode starting at fixed time intervals
- Low-power mode: Initiates a three-round scan mode when detecting a key press
- Software mode: Software-triggered scanning mode

## 2.18 Serial SWD Debugging Interface (SWD)

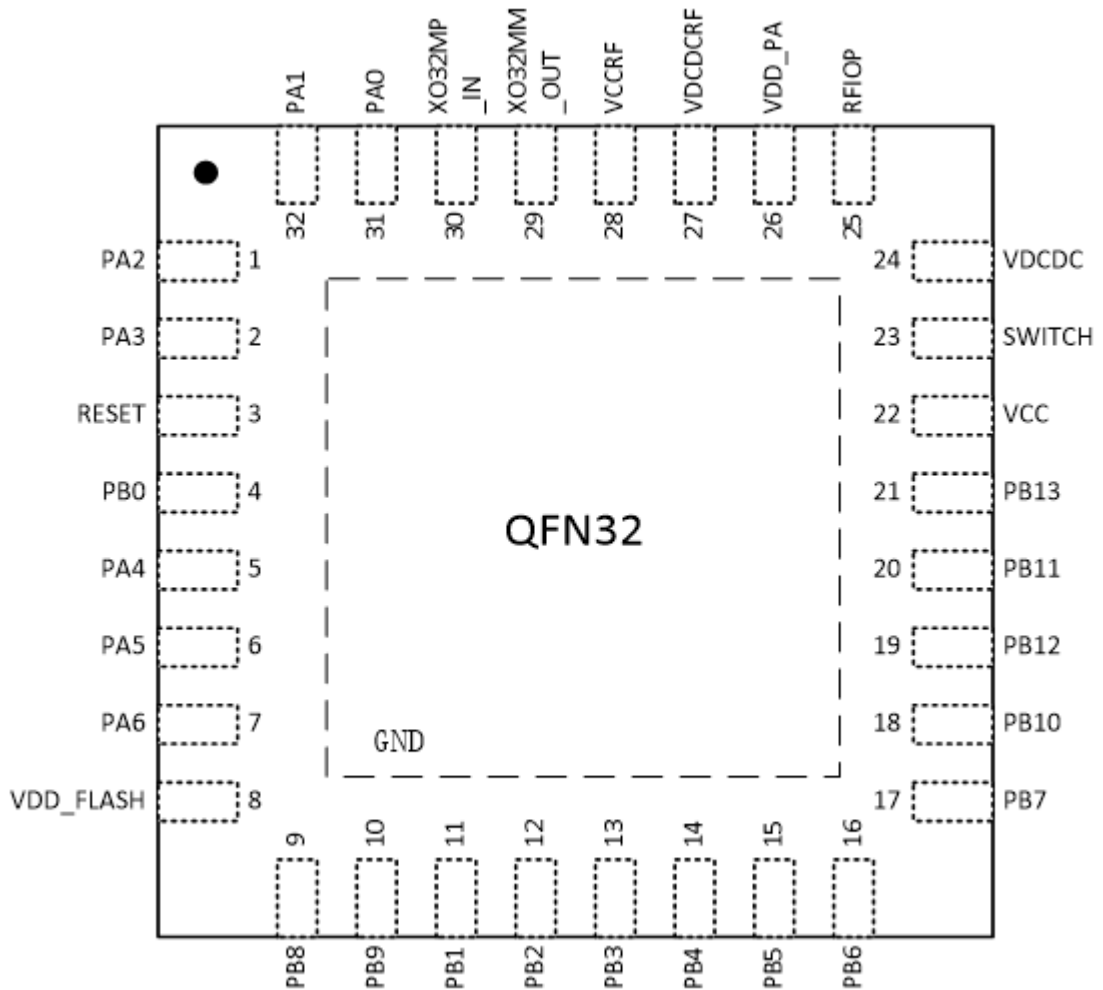

A SWJ-DP interface with built-in ARM, it integrates JTAG and serial single-wire debugging interfaces and supports connecting to the serial single-wire debugging interface or JTAG interface. The TMS and TCK signals of JTAG share pins with SWDIO and SWCLK respectively.

21	PB13	I/O	TIM1_CH2N LPUART_CTS USART2_CK	AMIC_P
22	VCC	S		Power supply for chip
23	SWITCH	S		DCDC external Interface
24	VDCDC	S		DCDC output
25	RFIOP	AIO		Antenna port
26	VDD_PA	S		PA power supply
27	VDCDCRF	S		DCDC output, connecting to VDCDC
28	VCCRF	S		Power supply for chip
29	XO32MM_OUT	AIO		External 32 MHz crystal
30	XO32MP_IN	AIO		External 32 MHz crystal
31	PA0	I/O	SPI1_NSS(I2S1_WS) KEY1	
32	PA1	I/O	SPI1_CLK(I2S1_CLK) KEY 2	
33	GND	S		Ground

*I = input, O = output, S = power supply, AIO = analog IO*

After reset, the I/O port is configured to the analog input mode. But the following signals are not applicable:

- Input pull-up mode for NRST by default
- PA4: SWCLK under the input pull-down mode
- PA5: SWDIO under the input pull-up mode

## 4 Electrical Characteristics

### 4.1 Test Condition

All voltages are based on  $V_{SS}$  unless otherwise specified.

#### 4.1.1 Minimum and Maximum

Unless otherwise specified, all minimums and maximums will be guaranteed under the worst ambient temperature, supply voltage and clock frequency conditions by testing 100% of the product at ambient temperature  $T_A=25^{\circ}\text{C}$  and  $T_A=T_{Amax}$  ( $T_{Amax}$  matches the specified temperature range) on the production line.

The annotations listed below each table are the data obtained through laboratory tests, design simulations and/or process characteristics, and will not be tested on the production line. On the basis of laboratory tests, the minimums and maximums are obtained by taking the average of the samples tested and adding to or subtracting from it three times the standard deviation (average  $\pm 3\sum$ ).

#### 4.1.2 Typical Values

Unless otherwise specified, the typical data is based on  $T_A=25^{\circ}\text{C}$  and  $VCC=3.3\text{ V}$  ( $1.8\text{V}/2.32\text{ V}\leq VCC\leq 3.6\text{ V}$ ). Such data is used for guiding the design only and is not tested.

#### 4.1.3 Typical Curve

Unless otherwise specified, the typical curve is used for guiding the design only and is not tested.

#### 4.1.4 Load Capacitance

Figure 4-1 shows the load conditions for measuring pin parameters.

**Figure 4-1 Pins Load Conditions**

#### 4.1.5 Pin Input Voltage

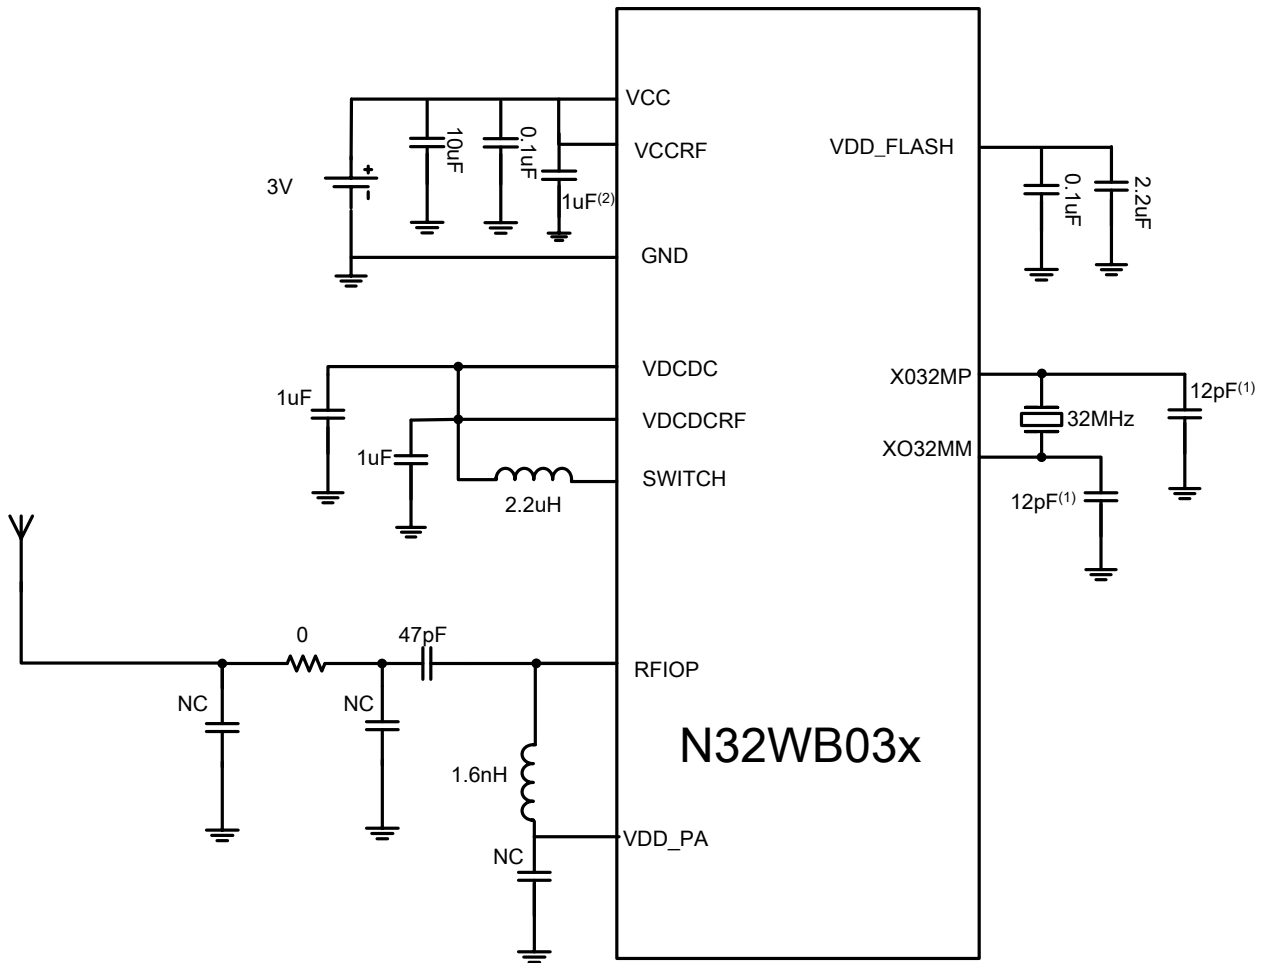

Figure 4-2 shows how to measure the input voltage of a pin.

**Figure 4-2 Pin Input Voltage**

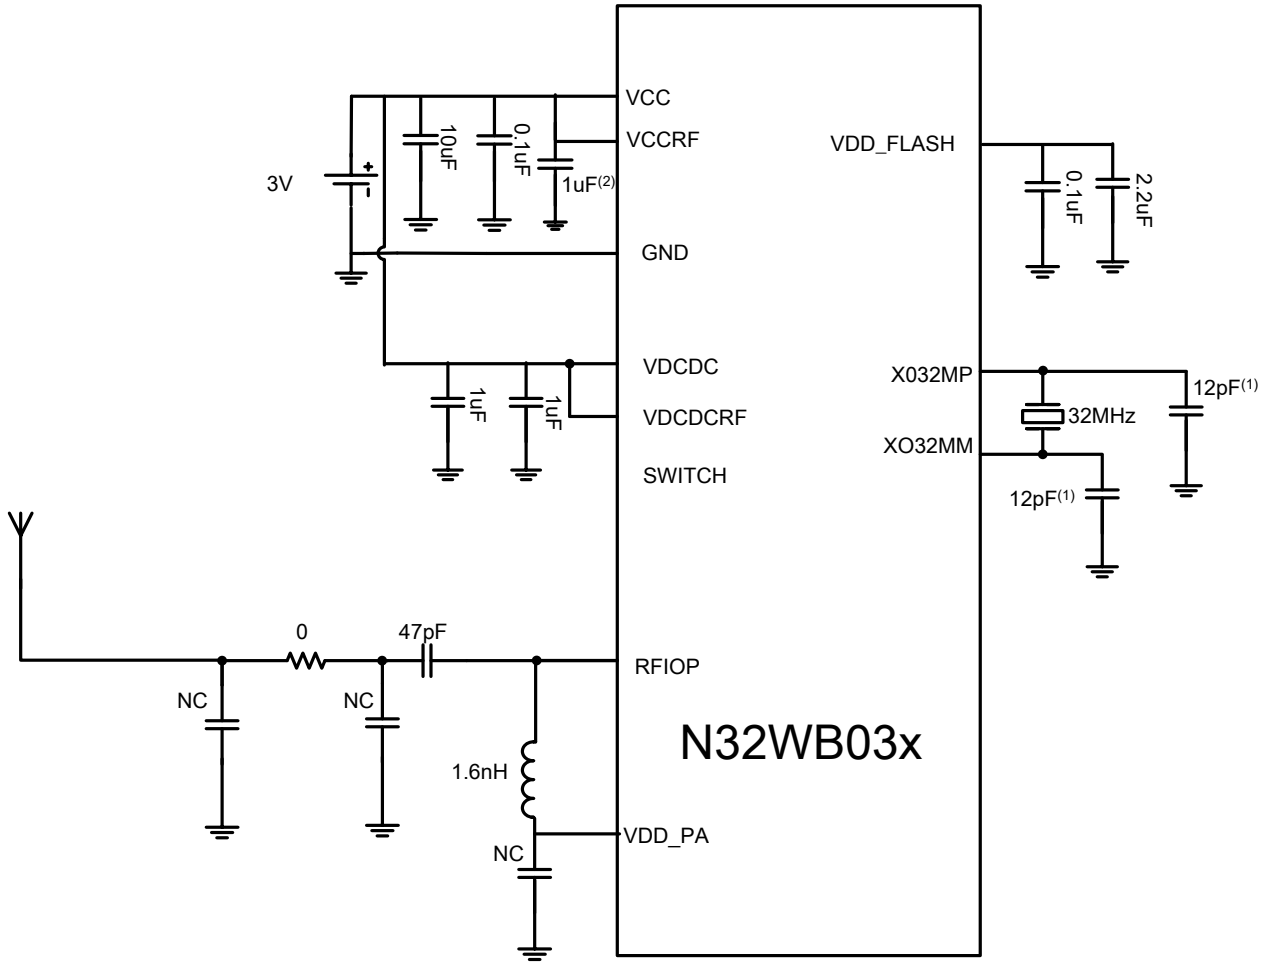

**4.1.6 Power Supply Plan**

**Figure 4-3 Power Supply Scheme**

(a) VDCDC/VDCDCRF uses the internal DCDC power supply

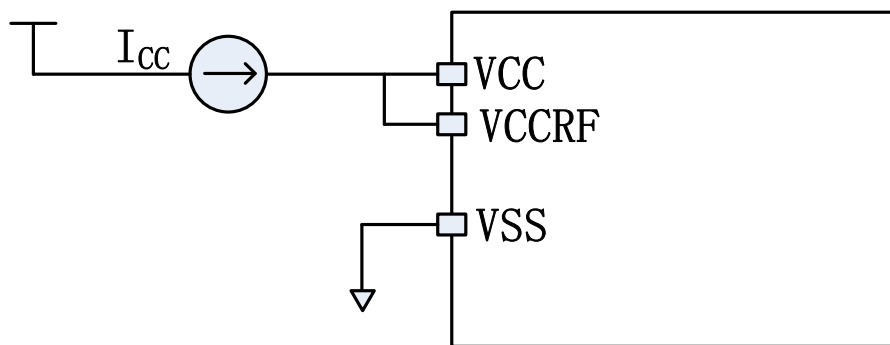

(b) VDCDC/VDCDCRF uses the external power supply

Notes:

- (1) The load capacitance  $C_L$  required by different crystals or resonators is usually different, refer to section 4.3.6 for details.
- (2) In the case of low ripple requirements, the 1uF capacitor can be used without soldering.

### 4.1.7 Current Consumption Measurement

Figure 4-4 Current Consumption Measurement Plan

## 4.2 Absolute Maximum Rating

The load applied to the device more than the value given in the "absolute maximum rating" tables (Tables 4-1, 4-2, and 4-3) may cause permanent damage to the device. The maximum allowable load is given here, but it does not mean that the functions of the device work well under these conditions. The device reliability will be affected if the device works at the maximum conditions for a long time.

**Table 4-1 Voltage Characteristics**

Symbol	Description	Minimum	Maximum	Unit
VCC-VSS	External main supply voltage (including VCCRF and VCC) <sup>(1)</sup>	-0.3	3.6	V
V <sub>IN</sub>	Input voltage on other pins <sup>(2)</sup>	VSS-0.3	VCC+0.3	
V <sub>ESD(HBM)</sub>	Electrostatic discharge (ESD) voltage (human body model)	See Section 4.3.10		

Notes:

- (1) All power supply (VCC, VCCRF) and ground (VSS) pins must be connected to an external power supply system within the permissible range.
- (2) I<sub>INJ(PIN)</sub> must not exceed its limit (see Table 4-2), ensuring that V<sub>IN</sub> does not exceed its maximum. If impossible, you need to guarantee that the external limit I<sub>INJ(PIN)</sub> does not exceed its maximum. When V<sub>IN</sub><VSS, there is a reverse injection current.

**Table 4-2 Current Characteristics**

Symbol	Description	Maximum (1)	Unit
I <sub>VCC</sub>	Total current (supply current) passing through VCC/VCCRF power cable <sup>(1)</sup>	150	mA
I <sub>VSS</sub>	Total current (output current) passing through VSS ground wire <sup>(1)</sup>	150	
I <sub>IO</sub>	Output sink current of any I/O and control pins	12	
	Output current of any I/O and control pins	-12	
I <sub>INJ(PIN)</sub> <sup>(2)(3)</sup>	Injection current of NRST pin	+/-5	
	Injection current of HSE's OSC_IN pin and LSE's OSC_IN pin	+/-5	
	Injection current of other pins <sup>(4)</sup>	+/-12	
∑I <sub>INJ(PIN)</sub> <sup>(2)</sup>	Total injection current of all I/O and control pins <sup>(4)</sup>	+/-150	

Notes:

- (1) All power supply (VCC, VCCRF) and ground (VSS) pins must be connected to an external power supply system within the permissible range.
- (2)  $I_{INJ(PIN)}$  must not exceed its limit, ensuring that  $V_{IN}$  does not exceed its maximum. If impossible, you need to guarantee that the external limit  $I_{INJ(PIN)}$  does not exceed its maximum.
- (3) When several I/O ports have injection current simultaneously, the maximum  $\sum I_{INJ(PIN)}$  is the sum of immediate absolute values of forward injection current and reverse injection current.

**Table 4-3 Temperature Characteristics**

Symbol	Description	Value	Unit
T <sub>STG</sub>	Storage temperature range	-40 to + 125	°C
T <sub>J</sub>	Maximum junction temperature	105	°C

## 4.3 Operating Conditions

### 4.3.1 General Operating Conditions

**Table 4-4 General Operating Conditions**

Symbol	Parameter	Condition	Minimum	Maximum	Unit
f <sub>HCLK</sub>	Internal AHB clock frequency			64	MHz
f <sub>CLK1</sub>	Internal APB1 clock frequency			32	
f <sub>CLK2</sub>	Internal APB2 clock frequency			64	
VCC	Standard operating voltage		1.8 <sup>(1)</sup>	3.6	V
VCCRF	Analog operating voltage		1.8 <sup>(1)</sup>	3.6	V
T <sub>A</sub>	Ambient temperature		-40	85	°C
T <sub>J</sub>	Junction temperature range		-40	105	°C

Note: <sup>(1)</sup> When the voltage on VCC/VCCRF fluctuates, N32WB031KEQ6-2 ensure that the minimum voltage fluctuation is greater than 2.32 V.

### 4.3.2 Power-on and Power-off Operating Conditions

The parameters in the following table are obtained by testing at the ambient temperature listed in Table 4-4.

**Table 4-5 Power-on and Power-off Operating Conditions**

Symbol	Parameter	Condition	Minimum	Maximum	Unit
T <sub>VCC</sub>	VCC rising speed	VCC=3.3 V	20	∞	μs/V
	VCC lowering speed		100	∞	

### 4.3.3 Characteristics of Built-in Reset and Power Control Module

The parameters given in the following table are obtained by testing at the ambient temperature and VCC supply voltage listed in Table 4-4.

**Table 4-6 Characteristics of Built-in Reset and Power Control Module<sup>(1)</sup>**

Symbol	Parameter	Condition	Minimum	Typical Value	Maximum	Unit
V <sub>BOR</sub>	VCC threshold power-on voltage	T <sub>A</sub> =25°C		1.65 <sup>(2)</sup>		V
	VCC threshold power-off voltage	T <sub>A</sub> =25°C		1.60 <sup>(2)</sup>		
V <sub>BORhyst</sub>	BOR delay	T <sub>A</sub> =25°C		20		mV

Notes:

<sup>(1)</sup> They are guaranteed by the design and are not tested in production.

<sup>(2)</sup> N32WB031KEQ6-2 VCC threshold power on voltage 2.27V, VCC threshold power off voltage 2.25V.

### 4.3.4 Characteristics of DCDC

DCDC is an internal voltage generation module. The parameters given in the following table are obtained by testing at the ambient temperature and VCC supply voltage listed in Table 4-4.

**Table 4-7 Built-in DCDC Power Management Module Characteristics<sup>(1)</sup>**

Symbol	Parameter	Condition	Minimum	Typical Value	Maximum	Unit
VCC	Supply voltage			3.3		V
VDCDC	DCDC output voltage			1.15		V
I <sub>load</sub>	DCDC current carrying capacity	Output current@ VDCDC=1.15 V			20	mA
η	DCDC conversion efficiency <sup>(2)</sup>			82.5		%
V <sub>RP</sub>	DCDC output voltage fluctuation			10		mV
L	DCDC load inductance		1	2.2	10	μH
C <sub>OUT</sub>	DCDC load capacitance		0.5	2	10	μF
t <sub>STAR</sub>	DCDC output voltage setup time			90		uS

Notes:

<sup>(1)</sup> They are guaranteed by the design and are not tested in production.

<sup>(2)</sup> The FDK MIPSDZ1608G2R2PA inductor is used in test. Different inductor models may vary in DCDC efficiency.

### 4.3.5 Characteristics of Supply Current

Current consumption is a composite indicator evaluated based on multiple parameters and factors, including operating voltage, ambient temperature, I/O pin load, software configuration, operating frequency, I/O pin switching rate, position of a program in memory, and code executed.

For the detailed method to measure current consumption, see Figure 4-4.

#### 4.3.5.1 Typical Current Consumption

**Table 4-8 Typical Current Consumption in Sleep Mode<sup>(1)</sup>**

Symbol	Parameter	Condition	Minimum	Typical Value <sup>(1)</sup>	Maximum <sup>(1)</sup>	Unit
I <sub>CC</sub>	Current in Sleep mode	Low speed clock: ON; 48 KB SRAM retention; I/O state unchanged		1.6	3.8	uA
	Current in PD mode	VCC is maintained; WAKEUP IO and NRST can be woken up		0.13	1.0	uA

Note: <sup>(1)</sup> The test condition is  $T_A=25^\circ\text{C}$ ,  $V_{CC}=3.3\text{ V}$ .

#### 4.3.5.2 Typical Current Consumption in Operating Mode

The chip is under the following conditions:

- All I/O pins are reset.
- All peripherals are turned off unless otherwise specified.
- Ambient temperature and VCC supply voltage conditions are listed in Table 4-4.

**Table 4-9 Typical Current Consumption in Operating Mode**

Symbol	Parameter	Condition	Typical Value <sup>(1)</sup>	Maximum	Unit
I <sub>CC</sub>	Supply current in operating mode	High speed internal RC oscillator (HSI) <sup>(2)</sup>	2.0		mA

Notes:

<sup>(1)</sup> The typical value is measured at  $T_A=25^\circ\text{C}$  and  $V_{CC}=3.3\text{ V}$ .

<sup>(2)</sup> High speed internal clock is 64 MHz.

**Table 4-10 BLE Power Consumption**

Symbol	Parameter	Condition	Typical Value <sup>(1)</sup>	Maximum	Unit
I <sub>CC</sub>	Supply current in operating mode	0 dbm transmitting power, VCC current	4.2		mA
		Minimum RX sensitivity, VCC current	3.8		mA
		1 s broadcast interval, VCC average current	13		uA

		100 ms broadcast interval, VCC average current	109		uA
		100 ms connection interval, VCC average current	70		uA

Note: <sup>(1)</sup> The typical value is measured at  $T_A=25^\circ\text{C}$  and  $V_{CC}=3.3\text{ V}$ .

### 4.3.6 Characteristics of External Clock Source

#### 4.3.6.1 High Speed External Clock Generated Using a Crystal/Ceramic Resonator

The high-speed external clock (HSE) can be generated by an oscillator consisting of a 32 MHz crystal/ceramic resonator. The data presented in this section is obtained from the overall characteristic evaluation using the typical external components listed in the table below. In applications, the resonator and load capacitor must be as close to the pin of the oscillator as possible to reduce output distortion and stabilization time at startup. For more parameters (such as frequency, encapsulation, and precision) of a crystal resonator, please contact the manufacturer. (The crystal resonator mentioned here usually means the passive crystal oscillator.)

**Table 4-11 Characteristics of HSE 32 MHz Oscillator<sup>(1)(2)</sup>**

Symbol	Parameter	Condition	Minimum	Typical Value	Maximum	Unit
f <sub>OSC_IN</sub>	Oscillator frequency			32		MHz
C <sub>L1</sub> C <sub>L2</sub> <sup>(3)</sup>	Recommended load capacitance and corresponding crystal serial impedance (RS) <sup>(4)</sup>	RS = 100Ω <sup>(4)</sup>		12		pF
I <sub>D</sub>	HSE drive current	VCC=3.3 V, 12 pF load		0.2		mA
t <sub>SU(HSE)</sub> <sup>(5)</sup>	Startup time			0.2		ms

Notes:

<sup>(1)</sup> Resonator's characteristic parameters are given by the manufacturers of crystal/ceramic resonators.

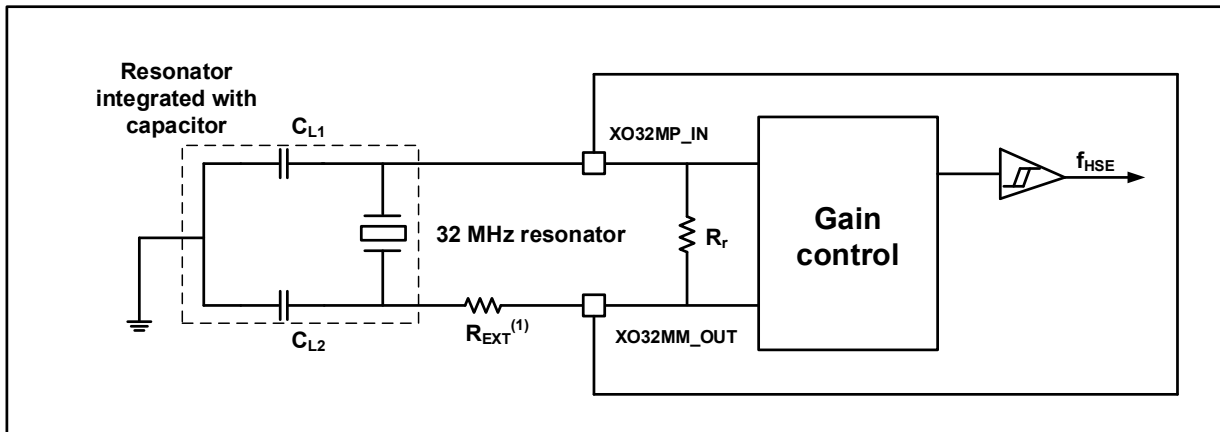

<sup>(2)</sup> They are obtained from laboratory tests and are not tested in production.

<sup>(3)(4)</sup> For C<sub>L1</sub> and C<sub>L2</sub>, it is recommended to use high-quality ceramic dielectric capacitors designed for high frequency applications and select suitable crystals or resonators. C<sub>L1</sub> and C<sub>L2</sub> usually share same parameters. Crystal manufacturers usually give the parameter of load capacitance as a serial combination of CL1 and CL2. When selecting C<sub>L1</sub> and C<sub>L2</sub>, you should consider the capacitive reactance of PCB and chip pins.

<sup>(5)</sup> t<sub>SU(HSE)</sub> is the startup time, which is measured from the moment when the software enables HSE until a stable 32 MHz oscillation is obtained. This value is measured on a standard crystal resonator and may vary greatly depending on the crystal manufacturer.

Figure 4-5 Typical Application with a 32 MHz Crystal

Note: The value of  $R_{EXT}$  depends on the characteristics of the crystal.

**4.3.6.2 Low Speed External Clock Generated Using a Crystal/Ceramic Resonator**

The low-speed external clock (LSE) can be generated by an oscillator consisting of a 32.768 kHz crystal/ceramic resonator. The data presented in this section is obtained from the overall characteristic evaluation using the typical external components listed in the table below. In applications, the resonator and load capacitor must be as close to the pin of the oscillator as possible to reduce output distortion and stabilization time at startup. For more parameters (such as frequency, encapsulation, and precision) of a crystal resonator, please contact the manufacturer. (The crystal resonator mentioned here usually means the passive crystal oscillator.)

Notes: For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use ceramic dielectric capacitors between 8 pF and 20 pF and select suitable crystals or resonators.  $C_{L1}$  and  $C_{L2}$  usually share the same parameters. Crystal manufacturers usually give the parameter of load capacitance as a serial combination of  $C_{L1}$  and  $C_{L2}$ . Different crystals or resonators usually require different load capacitance (CL). The selected  $C_{L1}$  and  $C_{L2}$  must match the crystal or resonator used.

The load capacitance CL is calculated by the formula:  $CL = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$ , where  $C_{stray}$  is the capacitance of the pin and the capacitance associated with the PCB or PCB, typically between 2 pF and 7 pF.

**Table 4-12 Characteristics of LSE Oscillator ( $f_{LSE}=32.768kHz$ )<sup>(1)</sup>**

Symbol	Parameter	Condition	Minimum	Typical Value	Maximum	Unit
$C_{L1}$ $C_{L2}^{(2)}$	Recommended load capacitance and corresponding crystal serial impedance (RS) <sup>(3)</sup>	RS: 30K $\Omega$ ~90K $\Omega$		10		pF
I2	LSE drive current	VCC=3.3 V, $C_{L1}=C_{L2}=10$ Pf, RS=30 K $\Omega$		0.2		$\mu$ A
$t_{SU(LSE)}^{(4)}$	Startup time			0.84		s

Notes:

<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

<sup>(2)</sup> See the "Notes" at the top of this table.

<sup>(3)</sup> Using a high-quality oscillator with a small RS value can optimize the current consumption. For more details, please contact the crystal manufacturer.

<sup>(4)</sup>  $t_{SU(LSE)}$  is the startup time, which is measured from the moment when the software enables LSE until a stable 32.768 KHz oscillation is obtained. This value is measured on a standard crystal resonator and may vary

greatly depending on the crystal manufacturer.

**Figure 4-6 Typical Application with a 32.768 kHz Crystal**

### 4.3.7 Characteristics of Internal Clock Source

The characteristic parameters given in the following table are obtained by testing at the ambient temperature and supply voltage listed in Table 4-4.

#### High Speed Internal (HSI) RC Oscillator

**Table 4-13 Characteristics of HSI Oscillator<sup>(1)(2)</sup>**

Symbol	Parameter	Condition	Minimum	Typical Value	Maximum	Unit
$f_{HSI}$	Frequency	$T_A = 25^\circ C$	63.36	64	64.64	MHz
$ACC_{HSI}$	Temperature drift of HSI oscillator	$T_A = -40\sim 105^\circ C$ , temperature drift	-3		3	%
		$T_A = -10\sim 85^\circ C$ , temperature drift	-2		2	%
		$T_A = 0\sim 70^\circ C$ , temperature drift	-1		1	%
$t_{SU(HSI)}$	Startup time of HSI oscillator				0.3	$\mu s$
$I_{CC(HSI)}$	Power dissipation of HSI oscillator			180	260	$\mu A$

Notes:

<sup>(1)</sup>  $V_{CC} = 3.3 V, T_A = -40\sim 105^\circ C$ .

<sup>(2)</sup> They are guaranteed by the design and are not tested in production.

#### Low Speed Internal (LSI) RC Oscillator

**Table 4-14 Characteristics of LSI Oscillator<sup>(1)</sup>**

Symbol	Parameter	Condition	Minimum	Typical Value	Maximum	Unit
$f_{LSI}^{(2)}$	Output frequency	Calibrated at $25^\circ C$	31.9	32	32.2	KHz
		$T_A = -40\sim 85^\circ C$ , temperature drift	-1		1	%
$t_{SU(LSI)}^{(3)}$	Startup time of LSI				200	$\mu s$

	oscillator					
$I_{CC(LSD)}^{(3)}$	Power dissipation of LSI oscillator			0.23		$\mu A$

Notes:

<sup>(1)</sup>  $V_{CC} = 3.3 V, T_A = -40\sim 85^\circ C$ .

<sup>(2)</sup> They are obtained from laboratory tests and are not tested in production.

<sup>(3)</sup> They are guaranteed by the design and are not tested in production.

### 4.3.8 Time Required to Wakeup from Low Power Modes

The wakeup time listed in Table 4-15 is measured during the wakeup phase of a 64 MHz HSI RC oscillator. The clock source used in wakeup depends on the current operating mode:

Sleep or PD mode: The clock source is a RC oscillator

All the time is measured under the ambient temperature and supply voltage listed in Table 4-4.

**Table 4-15 Time Required to Wake Up from Low Power Modes**

Symbol	Parameter	Minimum	Typical Value	Maximum	Unit
$t_{WUSLEEP}^{(1)}$	Wake up from Sleep mode		0.2		ms
$t_{WUPD}^{(1)}$	Wake up from PD mode		42		

Note: <sup>(1)</sup> The wakeup time is measured from the start of the wakeup event to the reading of the first command by the user program.

### 4.3.9 Characteristics of FLASH Memory

Unless otherwise specified, all characteristic parameters below are obtained at  $T_A = -40\sim 85^\circ C$ .

**Table 4-16 Characteristics of Memory**

Symbol	Parameter	Condition	Minimum	Typical Value <sup>(1)</sup>	Maximum <sup>(1)</sup>	Unit
$t_{PP}$	Page (256 bytes) programming time	$T_A = -40\sim 85^\circ C$		2	3	ms
$t_{PE}$	Page (256 bytes) erasing time	$T_A = -40\sim 85^\circ C$		16	30	ms
$t_{SE}$	Sector (4K byte) erase	$T_A = -40\sim 85^\circ C$		16	30	ms
$t_{CE}$	Chip erasing time	$T_A = -40\sim 85^\circ C$		16	30	ms

Note: <sup>(1)</sup> They are guaranteed by the design and are not tested in production.

**Table 4-17 Flash Memory Life and Data Retention Period**

Symbol	Parameter	Condition	Minimum <sup>(1)</sup>	Unit
$N_{END}$	Life (note: erasure times)	$T_A = -40\sim 85^\circ C$	10	Ten thousand times
		$T_A = -40\sim 105^\circ C$	1	Ten thousand times
$t_{RET}$	Data retention period	$T_A = 105^\circ C$	20	Year

Note:<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

### 4.3.10 Absolute Maximum (Electrical Sensitivity)

Electrical sensitivity is determined by testing the chip strength using specified measurement methods based on three different tests (ESD, LU).

#### Electrostatic Discharge (ESD)

Electrostatic discharge (one positive pulse followed by one negative pulse after one second) is applied to all pins of all samples, and the sample size depends on the number of power supply pins on the chip ( $3 \times (n+1)$  power supply pins). This test complies with the MIL-STD-883K and ESDA/JEDEC JS -002-2018 standards.

**Table 4-18 Absolute Maximum of ESD**

Symbol	Parameter	Condition	Type	Minimum <sup>(1)</sup>	Unit
$V_{ESD(HBM)}$	ESD voltage (human body model)	$T_A = +25^\circ\text{C}$ , MIL-STD-883K compliant	II	2000	V
$V_{ESD(CDM)}$	ESD voltage (charging device model)	$T_A = +25^\circ\text{C}$ , ESDA/JEDEC JS -002-2018 compliant	II	1000	

Note:<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

#### Static Latch-Up

Provide a supply voltage exceeding the limit for each power supply pin.

Inject current into each input, output and configurable I/O pin.

This test complies with JEDEC78E integrated circuit latch-up standard.

**Table 4-19 Electrical Sensitivity**

Symbol	Parameter	Condition	Type
LU	Static latch-up	$T_A = +25/+85^\circ\text{C}$ , JEDEC78E compliant	Class II A

### 4.3.11 I/O port characteristics

#### Characteristics of General-Purpose Input/Output

Unless otherwise specified, the parameters given in the following table are obtained by measuring under the conditions listed in Table 4-4. All I/O ports are compatible with CMOS and TTL.

**Table 4-20 Static Characteristics of I/O<sup>(1)(2)</sup>**

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$V_{IL}$	Input low level voltage	$V_{CC}=3.3\text{ V}$	VSS	0.8	V
		$V_{CC}=2.5\text{ V}$	VSS	0.7	
$V_{IH}$	Input high level voltage	$V_{CC}=3.3\text{ V}$	2	$V_{CC}$	
		$V_{CC}=2.5\text{ V}$	1.7	$V_{CC}$	
$V_{hys}$	Hysteresis voltage of Schmitt trigger <sup>(1)</sup>	$V_{CC}=3.3\text{ V}/2.5\text{ V}$	200		mV

I <sub>lkg</sub>	Input leakage current <sup>(3)</sup>	V <sub>PAD</sub> =0	-1	1	μA
		V <sub>PAD</sub> =V <sub>CC</sub>			
R <sub>PU</sub>	Weak pull-up equivalent resistance <sup>(4)</sup>	V <sub>CC</sub> =3.3 V V <sub>IN</sub> = V <sub>IL</sub>	120	140	kΩ
R <sub>PD</sub>	Weak pull-down equivalent resistance <sup>(4)</sup>	V <sub>CC</sub> =3.3 V V <sub>IN</sub> = V <sub>IH</sub>	120	140	kΩ
C <sub>IO</sub>	Capacitance of I/O pin			0.1	pF

Note:

<sup>(1)(2)</sup> Hysteresis voltage of Schmitt trigger's switching level. They are obtained from laboratory tests and are not tested in production.

<sup>(3)</sup> The leakage current may exceed the maximum if there is reverse sink current on adjacent pins.

### Output Drive Current

GPIO (general purpose input/output port) can absorb or output up to +/-12 mA current.

### Output Voltage

**Table 4-21 I/O Output Voltage**

Symbol	Parameter	Condition	Minimum	Maximum	Unit
V <sub>OL</sub>	Output low level	V <sub>CC</sub> =3.3, I <sub>OH</sub> =2 mA, 4 mA, 8 mA, 12 mA	V <sub>SS</sub>	0.4	V
		V <sub>CC</sub> =2.5, I <sub>OH</sub> =2 mA, 4 mA, 8 mA, 12 mA	V <sub>SS</sub>	0.4	
V <sub>OH</sub>	Output high level	V <sub>CC</sub> =3.3 V, I <sub>OH</sub> = -2 mA, -4 mA, -8 mA, -12 mA	2.4	V <sub>CC</sub>	
		V <sub>CC</sub> =2.5 V, I <sub>OH</sub> = -2 mA, -4 mA, -8 mA, -12 mA	2	V <sub>CC</sub>	

### Input and Output AC Characteristics

The definitions and values of input and output AC characteristics are given in Table 4-22.

Unless otherwise specified, the parameters given in the following table are obtained by measuring at the ambient temperature and supply voltage listed in Table 4-4.

**Table 4-22 Input and Output AC Characteristics<sup>(1)</sup>**

Register	Symbol	Parameter	Condition	Minimum	Maximum	Unit
Configuration						
00 (2 mA)	f <sub>max(I/O)out</sub>	Maximum frequency	C <sub>L</sub> =5 pF, V <sub>CC</sub> =3.3 V		64	MHz
			C <sub>L</sub> =5 pF, V <sub>CC</sub> =2.5 V		50	
	t <sub>(IO)out</sub>	Output delay	C <sub>L</sub> =5 pF, V <sub>CC</sub> =3.3 V		3.66	ns

			$C_L=5\text{ pF}, V_{CC}=2.5\text{ V}$		4.72	
	$t_{(IO)in}$	Input delay	$C_L=50\text{ fF}, V_{CC}=2.97\text{ V}$		1.2	ns
			$V_{CC}=2.5\text{ V}$			
01 (4 mA)	$f_{max(IO)out}$	Maximum frequency	$C_L=10\text{ pF}, V_{CC}=3.3\text{ V}$		64	MHz
			$C_L=10\text{ pF}, V_{CC}=2.5\text{ V}$		60	
	$t_{(IO)out}$	Output delay	$C_L=10\text{ pF}, V_{CC}=3.3\text{ V}$		3.5	ns
			$C_L=10\text{ pF}, V_{CC}=2.5\text{ V}$		4.5	
$t_{(IO)in}$	Input delay	$C_L=50\text{ fF}, V_{CC}=2.97\text{ V}$		1.2	ns	
		$C_L=50\text{ fF}, V_{CC}=2.5\text{ V}$				
10 (8 mA)	$f_{max(IO)out}$	Maximum frequency	$C_L=20\text{ pF}, V_{CC}=3.3\text{ V}$		64	MHz
			$C_L=20\text{ pF}, V_{CC}=2.5\text{ V}$		50	
	$t_{(IO)out}$	Output delay	$C_L=20\text{ pF}, V_{CC}=3.3\text{ V}$		3.42	ns
			$C_L=20\text{ pF}, V_{CC}=2.5\text{ V}$		4.73	
$t_{(IO)in}$	Input delay	$C_L=50\text{ fF}, V_{CC}=2.97\text{ V}$		1.2	ns	
		$C_L=50\text{ fF}, V_{CC}=2.5\text{ V}$				
11 (12 mA)	$f_{max(IO)out}$	Maximum frequency	$C_L=30\text{ pF}, V_{CC}=3.3\text{ V}$		64	MHz
			$C_L=30\text{ pF}, V_{CC}=2.5\text{ V}$		50	
	$t_{(IO)out}$	Output delay	$C_L=30\text{ pF}, V_{CC}=3.3\text{ V}$		3.34	ns
			$C_L=30\text{ pF}, V_{CC}=2.5\text{ V}$		4.26	
$t_{(IO)in}$	Input delay	$C_L=50\text{ fF}, V_{CC}=2.97\text{ V}$		1.2	ns	
		$C_L=50\text{ fF}, V_{CC}=2.5\text{ V}$				

Note:<sup>(1)</sup> They are guaranteed by the design and are not tested in production.

**Figure 4-7 Definition of Input and Output AC Characteristics**

### 4.2.12 Characteristics of NRST

The NRST pin's input drive uses the CMOS process and is connected to a pull-up resistor  $R_{PU}$  that cannot be disconnected. Unless otherwise specified, the parameters given in Table 4-23 are obtained by measuring at the ambient temperature and supply voltage listed in Table 4-4.

**Table 4-23 Characteristics of NRST Pins**

Symbol	Parameter	Condition	Minimum	Typical Value	Maximum	Unit
$V_{IL(NRST)}^{(1)}$	NRST input low level voltage	$V_{CC} = 3.3\text{ V}$	$V_{SS}$	-	0.8	V
$V_{IH(NRST)}^{(1)}$	NRST input high level voltage	$V_{CC} = 3.3\text{ V}$	2	-	$V_{CC}$	
$V_{hys(NRST)}^{(1)}$	Hysteresis voltage of NRST Schmitt trigger	-	-	200	-	mV
$R_{PU}$	Weak pull-up equivalent resistance	$V_{CC} = 3.3\text{ V}$	40	50	60	$k\Omega$
$V_{F(NRST)}^{(1)}$	NRST input filter pulse	-	-	-	500	ns
$V_{NF(NRST)}^{(1)}$	NRST input unfiltered pulse	-	5	-	-	us

Note:<sup>(1)</sup> They are guaranteed by the design and are not tested in production.

**Figure 4-8 Recommended NRST Pin Protection**

Note:

<sup>(1)</sup> The external reset network is to avoid a parasitic reset.

<sup>(2)</sup> Users must ensure that the potential of the NRST pin is below the maximum  $V_{IL(NRST)}$  listed in Table 4-23. Otherwise, the chip cannot be reset.

### 4.3.13 Characteristics of TIM Timer

The parameters given in Table 4-24 are obtained by measuring at the ambient temperature and supply voltage listed in Table 4-4.

**Table 4-24 Characteristics of TIMx<sup>(1)(2)</sup>**

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$t_{res(TIM)}$	Timer resolution time	$f_{TIMxCLK} = 64 \text{ MHz}$	1		$t_{TIMxCLK}$
			15.625		ns
$f_{EXT}$	Timer's external clock frequency (CH1~CH4)		0	$f_{TIMxCLK}/2$	MHz
			0	32	MHz
$Res_{TIM}$	Timer resolution			16	Bit
$t_{COUNTER}$	Clock period of a 16-bit counter when an internal clock is selected		1	65536	$t_{TIMxCLK}$
			0.015625	1024	$\mu\text{s}$
$t_{MAX\_COUNT}$	Maximum possible count			65536x65536	$t_{TIMxCLK}$
				67.1	s

Note:

<sup>(1)</sup> TIMx is a generic name that represents TIM1/TIM3/TIM6.

<sup>(2)</sup> Parameters are guaranteed by the design.

### 4.3.14 Characteristics of I2C Interface

Unless otherwise specified, the parameters below are obtained by measuring at the ambient temperature,  $f_{PCLK1}$  frequency, and VCC supply voltage listed in Table 4-4.

The I2C interface conforms to the standard I2C communication protocol but is subject to the following limitations: SDA and SCL are not "real" open-drain pins, and when they are configured as output open-drain, the PMOS transistor between the lead-out pin and VCC is turned off, but still exists.

The characteristics of I2C interface are shown in the table below. For more details on the characteristics of the input/output alternate function pins (SDA and SCL), see Section 4.3.11.

**Table 4-25 Characteristics of I2C Interface<sup>(1)</sup>**

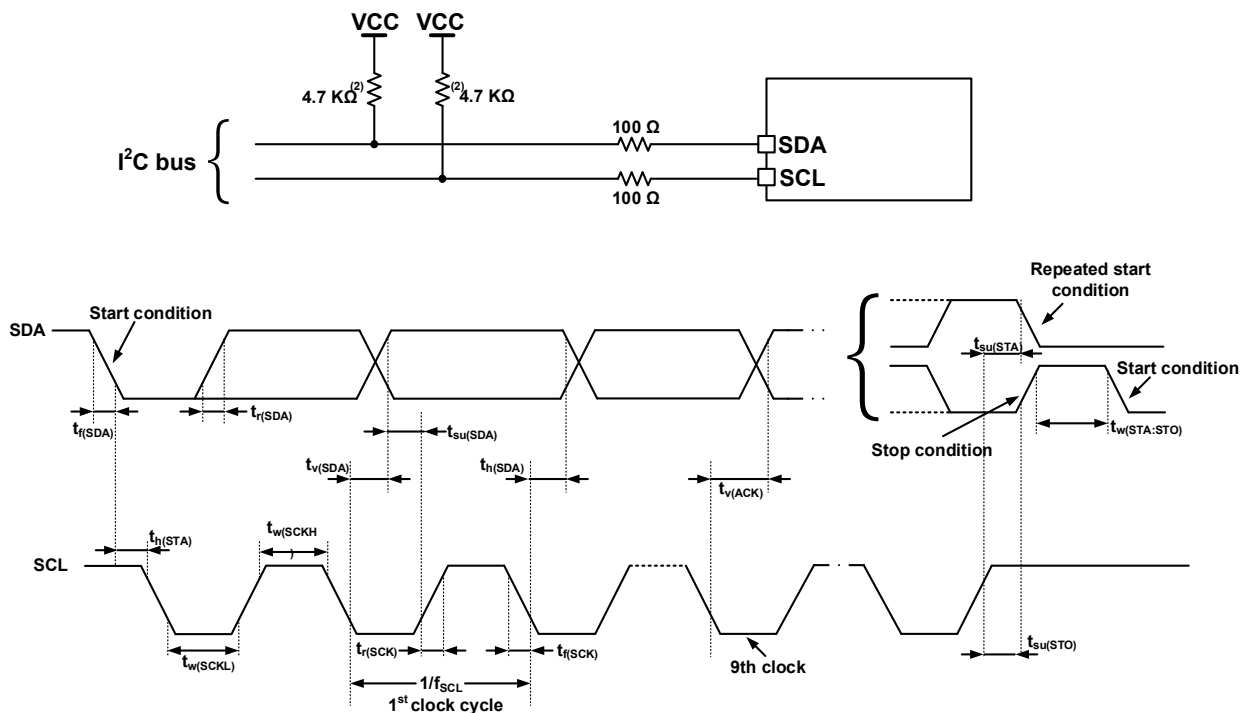

Symbol	Parameter	Standard Mode		Fast Mode		Unit
		Minimum	Maximum	Minimum	Maximum	
$f_{SCL}$	I2C Interface Frequency		100		1000	KHz
$t_{h(STA)}$	Start condition holding time	4.0		0.6		$\mu s$
$t_{w(SCLL)}$	SCL clock low time	4.7		1.3		$\mu s$
$t_{w(SCLH)}$	SCL clock high time	4.0		0.6		$\mu s$
$t_{su(STA)}$	Setup time for a repeated start condition	4.7		0.6		$\mu s$
$t_{h(SDA)}$	SDA data hold time		3.4		0.9	$\mu s$
$t_{su(SDA)}$	SDA setup time	250.0		100		ns
$t_{r(SDA)}$ $t_{r(SCL)}$	SDA and SCL rise time		1000	20	300	ns
$t_{f(SDA)}$ $t_{f(SCL)}$	SDA and SCL fall time		300		300	ns
$t_{su(STO)}$	Setup time for a stop condition	4.0		0.6		$\mu s$
$t_{w(STO:STA)}$	Time from stop condition to start condition (bus idle)	4.7		1.3		$\mu s$
$C_b$	Capacitive load per bus		400		100	pf
$t_{v(SDA)}$	Data validity time	3.45		0.9		$\mu s$
$t_{v(ACK)}$	Valid time of acknowledgement	3.45		0.9		$\mu s$

Note:

<sup>(1)</sup> They are guaranteed by the design and are not tested in production.

<sup>(2)</sup> To reach the maximum frequency of standard mode I2C,  $f_{PCLK1}$  must be greater than 2 MHz. To reach the maximum frequency of fast mode I2C,  $f_{PCLK1}$  must be greater than 4 MHz.

Figure 4-9 AC Waveform and Measuring Circuit of I2C Bus<sup>(1)</sup>

Note:<sup>(1)</sup> The measuring points are set at CMOS levels: 0.3 VCC and 0.7 VCC.

### 4.3.15 Characteristics of SPI

Unless otherwise specified, the SPI parameters are obtained by measuring at the ambient temperature,  $f_{PCLK2}$  frequency, and VCC supply voltage listed in Table 4-4.

For more details on the characteristics of the input/output alternate function pins (NSS, SCLK, MOSI, MISO), see Section 4.3.11.

Table 4-26 Characteristics of SPI<sup>(1)</sup>

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$f_{SCLK}$ $1/t_c(SCLK)$	SPI clock frequency	Master mode	-	16	MHz
		Slave mode	-	16	
$t_r(SCLK)t_f(SCLK)$	SPI's clock rise and fall time	Load capacitance: C = 30 pF	-	8	ns
$DuCy_{(SCK)}$	Duty cycle of SPI's slave input clock	SPI slave mode	30	70	%
$t_{su(NSS)}^{(1)}$	NSS setup time	Slave mode	$4t_{PCLK}$	-	ns
$t_{h(NSS)}^{(1)}$	NSS hold time	Slave mode	$2t_{PCLK}$	-	ns

$t_{w(SCLKH)}^{(1)}$ $t_{w(SCLKL)}^{(1)}$	SCLK high and low time	Master mode		$t_{PCLK} - 2$	$t_{PCLK} + 2$	ns
$t_{su(MI)}^{(1)}$	Data input setup time	Master mode	SPI1	5	-	ns
			SPI2	6		
$t_{su(SI)}^{(1)}$		Slave mode	SPI1	5		
			SPI2	6		
$t_{h(MI)}^{(1)}$	Data input hold time	Master mode		4		ns
$t_{h(SI)}^{(1)}$		Slave mode		3		
$t_{a(SO)}^{(1)(2)}$	Data output access time	Slave mode, $f_{PCLK} = 32 \text{ MHz}$		0	$3t_{PCLK}$	ns
$t_{dis(SO)}^{(1)(3)}$	Data output disabled time	Slave mode		2	10	ns
$t_{v(SO)}^{(1)}$	Data output valid time	Slave mode (after enabled edge)	SPI1		16	ns
			SPI2		20	
$t_{v(MO)}^{(1)}$		Master mode (after enabled edge)	SPI1		8	
			SPI2		10	
$t_{h(SO)}^{(1)}$	Data output hold time	Slave mode (after enabled edge)		2		ns
$t_{h(MO)}^{(1)}$		Master mode (after enabled edge)		0		

Note:

<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

<sup>(2)</sup> The minimum represents the minimum time to drive the output, and the maximum represents the maximum time to obtain the data correctly.

<sup>(3)</sup> The minimum represents the minimum time to turn off the output, and the maximum represents the maximum time to put the data line in a high impedance state.

Figure 4-10 SPI Sequence Diagram–Slave Mode and CPHA=0

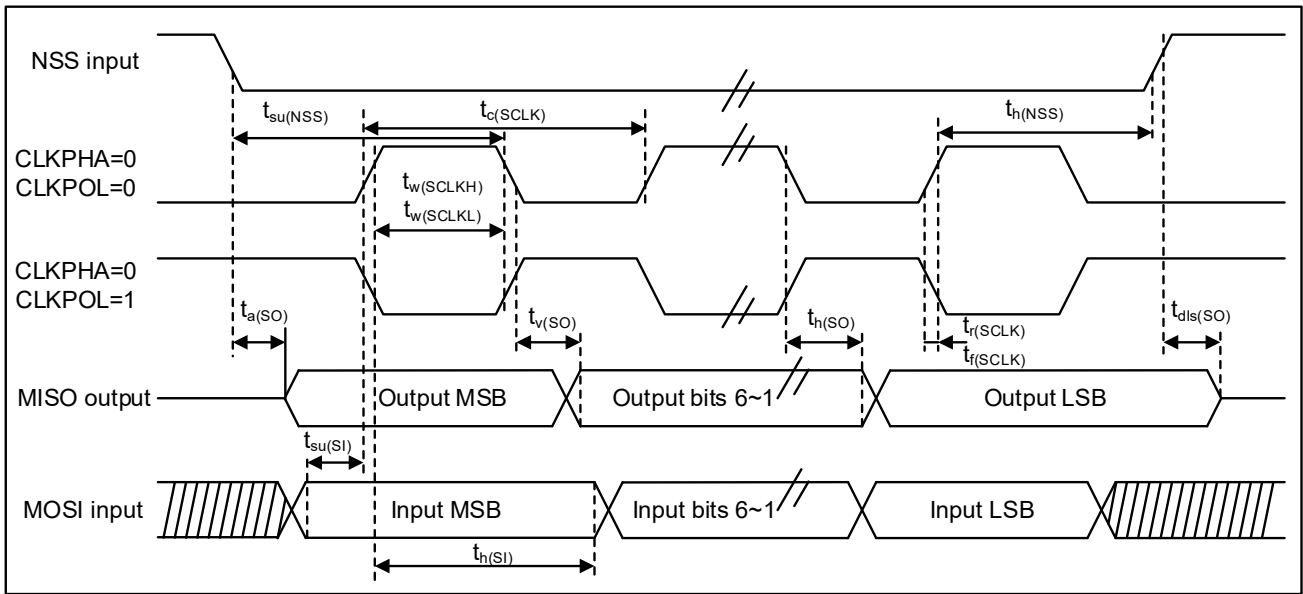

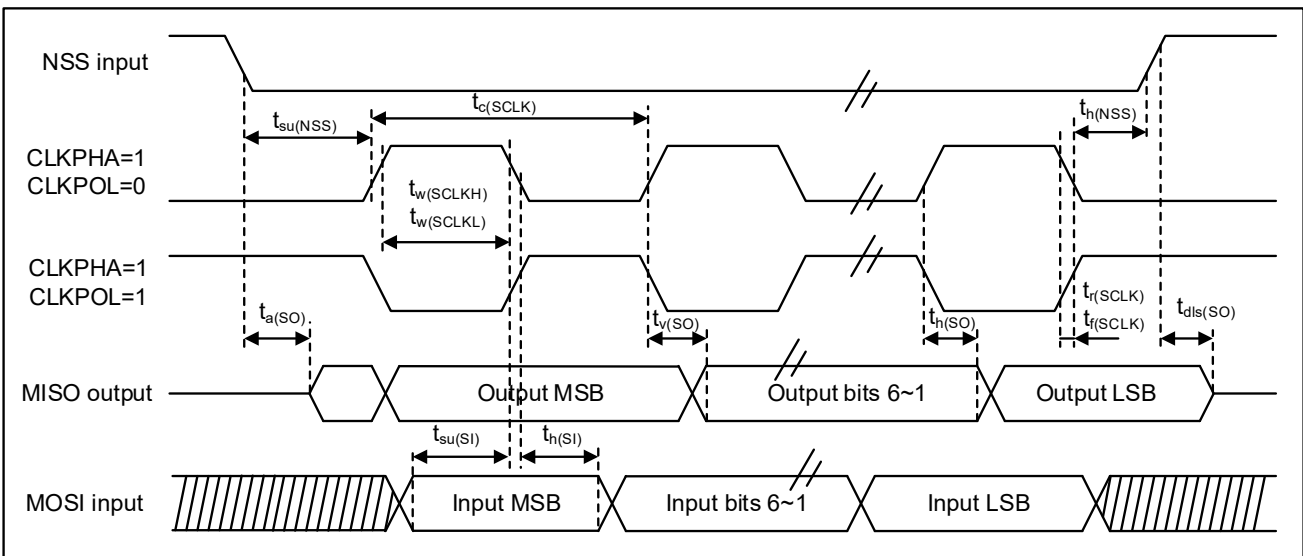

Figure 4-11 SPI Sequence Diagram–Slave Mode and CPHA=1<sup>(1)</sup>

Note:<sup>(1)</sup> The measuring points are set at CMOS levels: 0.3 VCC and 0.7 VCC.

Figure 4-12 SPI Sequence Diagram—Master Mode<sup>(1)</sup>

Note:<sup>(1)</sup> The measuring points are set at CMOS levels: 0.3 VCC and 0.7 VCC.

### 4.3.16 Characteristics of Temperature Sensor (TS)

Unless otherwise specified, the parameters below are obtained by measuring at the ambient temperature,  $f_{HCLK}$  frequency, and VCC supply voltage listed in Table 4-4.

Table 4-27 Characteristics of Temperature Sensor

Symbol	Parameter	Minimum	Typical Value	Maximum	Unit
$T_L^{(1)}$	$V_{SENSE}$ Linearity with respect to temperature		$\pm 4$		$^{\circ}C$
Avg_Slope <sup>(1)</sup>	Average slope		2.14 <sup>(2)</sup>		mV/ $^{\circ}C$
$t_{START}^{(1)}$	Setup time			10	$\mu s$

Note:

<sup>(1)</sup> They are guaranteed by the design and are not tested in production.

<sup>(2)</sup> They are obtained from laboratory tests and are not tested in production.

### 4.3.17 Characteristics of ADC

Unless otherwise specified, the parameters below are obtained by measuring at the ambient temperature,  $f_{\text{CLK}}$  frequency, and VCC supply voltage listed in Table 4-4.

**Table 4-28 Characteristics of ADC**

Symbol	Parameter	Test Condition	Minimum	Typical Value	Maximum	Unit
$V_{\text{REF+}}$	Positive reference voltage			1.0		V
$f_{\text{ADC}}$	ADC sampling rate				1.33	MHz
$V_{\text{AIN}}$	Voltage conversion range, external low voltage path		0		1000	mV
	Voltage conversion range, external high voltage path		0	-	3600 <sup>(2)</sup>	mV
$R_{\text{ADC}}$	Sampling switch resistance					k $\Omega$
$C_{\text{ADC}}$	Internal sampling and holding capacitance					pF
SNDR	Integral noise distortion ratio	Input Frequency=1.03 KHz, VCC=3.3 V, $T_A=25^\circ\text{C}$  $f_{\text{ADC}}=1\text{MSPS}$		46		dBFS
SNDR	Integral noise distortion ratio	Input Frequency=0.98 KHz, VCC=3.3 V, $T_A=25^\circ\text{C}$  $f_{\text{ADC}}=16\text{KSPS}$		58		dBFS
$t_{\text{STAB}}^{(1)}$	Power-on time			16		$\mu\text{s}$
$t_{\text{CONV}}^{(1)}$	Conversion time		752			ns
DNL	Differential linear error	VCC=3.3 V, $T_A=25^\circ\text{C}$ ,	-1		6	LSB
INL	Integral linear error	VCC=3.3 V, $T_A=25^\circ\text{C}$	-8		2	LSB

Note:

<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

<sup>(2)</sup> The maximum value 3600 mV and  $\leq V_{\text{CC}} + 300\text{ mV}$ .

### 4.3.18 Characteristics of PGA

Unless otherwise specified, the parameters below are obtained by measuring the ambient temperature and VCC supply voltage listed in Table 4-4.

**Table 4-29 Characteristics of PGA**

Symbol	Parameter	Test Condition	Minimum	Typical Value	Maximum	Unit
GAIN	PGA gain		0		42	dB
GAIN STEP	PGA gain step			6		dB
THD+N <sup>(1)</sup>	Gain=0dB		73	82	85	dB
	Gain=42 dB		73	83	87	dB
In-band ripple <sup>(1)</sup>	Gain fluctuation in 300–3400 Hz band			0.78		dB
T <sub>PGA</sub> <sup>(1)</sup>	PGA setup time			15		ms
MIC_BIAS voltage	MIC bias voltage, step=0.1 V		1.6		2.3	V
MIC_BIAS Noise <sup>(1)</sup>	20Hz to 8kHz A-weighted with 4.7uF			-92		dBV

Note:<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

### 4.3 19 Characteristics of KEYSKAN

Unless otherwise specified, the parameters below are obtained by measuring the ambient temperature and VCC supply voltage listed in Table 4-4.

**Table 4-30 Characteristics of KEYSKAN**

Symbol	Parameter	Test Condition	Minimum	Typical Value	Maximum	Unit
T <sub>WTS</sub>	Time interval for each round of keyboard scanning			32	224	ms
T <sub>DTS</sub>	Key jitter elimination time		10		640	ms
I <sub>cc</sub> <sup>(1)</sup>	Power dissipation in automatic scanning mode (104 keys)	T <sub>DTS</sub> =40 ms, T <sub>WTS</sub> =32 ms VCC=3.3 V, T <sub>A</sub> =25 °C		2.9		uA

	Power dissipation in low power mode (104 keys)	VCC=3.3 V, T <sub>A</sub> =25 °C		2.3		uA
--	---	----------------------------------	--	-----	--	----

Note:<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

### 4.3.20 Characteristics of BLE

Unless otherwise specified, the parameters below are obtained by measuring the ambient temperature and VCC supply voltage listed in Table 4-4.

**Table 4-31 BLE Receiving Characteristics<sup>(1)</sup>**

No.	Parameter	Test Condition	Minimum	Typical Value	Maximum	Unit
1	Sensitivity, 1 Mbps	VCC=3.3 V, T <sub>A</sub> =25 °C		-96		dBm
2	Sensitivity, 2 Mbps			-93		dBm
3	Co-channel interference			8		dB
4	Adjacent channel interference, +1 MHz			1		dB
5	Adjacent channel interference, +2 MHz			-31		dB
6	Adjacent channel interference, >=+3 MHz			-40		dB
7	Mirror channel interference			-24		dB
8	Adjacent mirror channel interference, +1 MHz			-28		dB
9	Maximum input power				6	dBm

Note:<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.

**Table 4-32 BLE Transmitting Characteristics<sup>(1)</sup>**

No.	Parameter	Test Condition	Minimum	Typical Value	Maximum	Unit
1	Output power	VCC=3.3 V, T <sub>A</sub> =25 °C		6		dBm
2	Frequency accuracy			7.5		kHz

3	Frequency drift rate			-9.4		kHz/50us
4	Frequency drift			-15.1		kHz
5	Initial frequency drift			-13.2		kHz
6	$\Delta f_1$ average			258		kHz
7	$\Delta f_2$ 99.9%			218		kHz
8	$\Delta f_2/\Delta f_1$			1.06		-
9	Harmonic power, second harmonic			-26		dBm
10	Harmonic power, third harmonic			-28		dBm
11	Harmonic power, fourth harmonic			-54		dBm
12	Harmonic power, quintuple harmonic			-55		dBm

Note:<sup>(1)</sup> They are obtained from laboratory tests and are not tested in production.
